AccuRain - Giving Roof Lines a designer edge

RainGutter Concept

The two most dangerous forces that can damage your home and are most likely to do so are TIME & WATER. While there is nothing you can do about time, there is a lot you can do to keep water as far as away from your home as possible. This includes having Rain Gutter System at the eaves of the roof to direct the water away from the walls & truss to a desired location.

If water is not properly channeled away from your home, it will invariably get directed at your home damaging the paint and structural integrity of wall and roof truss. This is why having new properly functioning roof gutter is the best way of spending money on your home.

Basic Components

A RainGutter - This is a narrow channel or trough, forming the component of a roof system which collects and diverts rainwater shed by the roof.

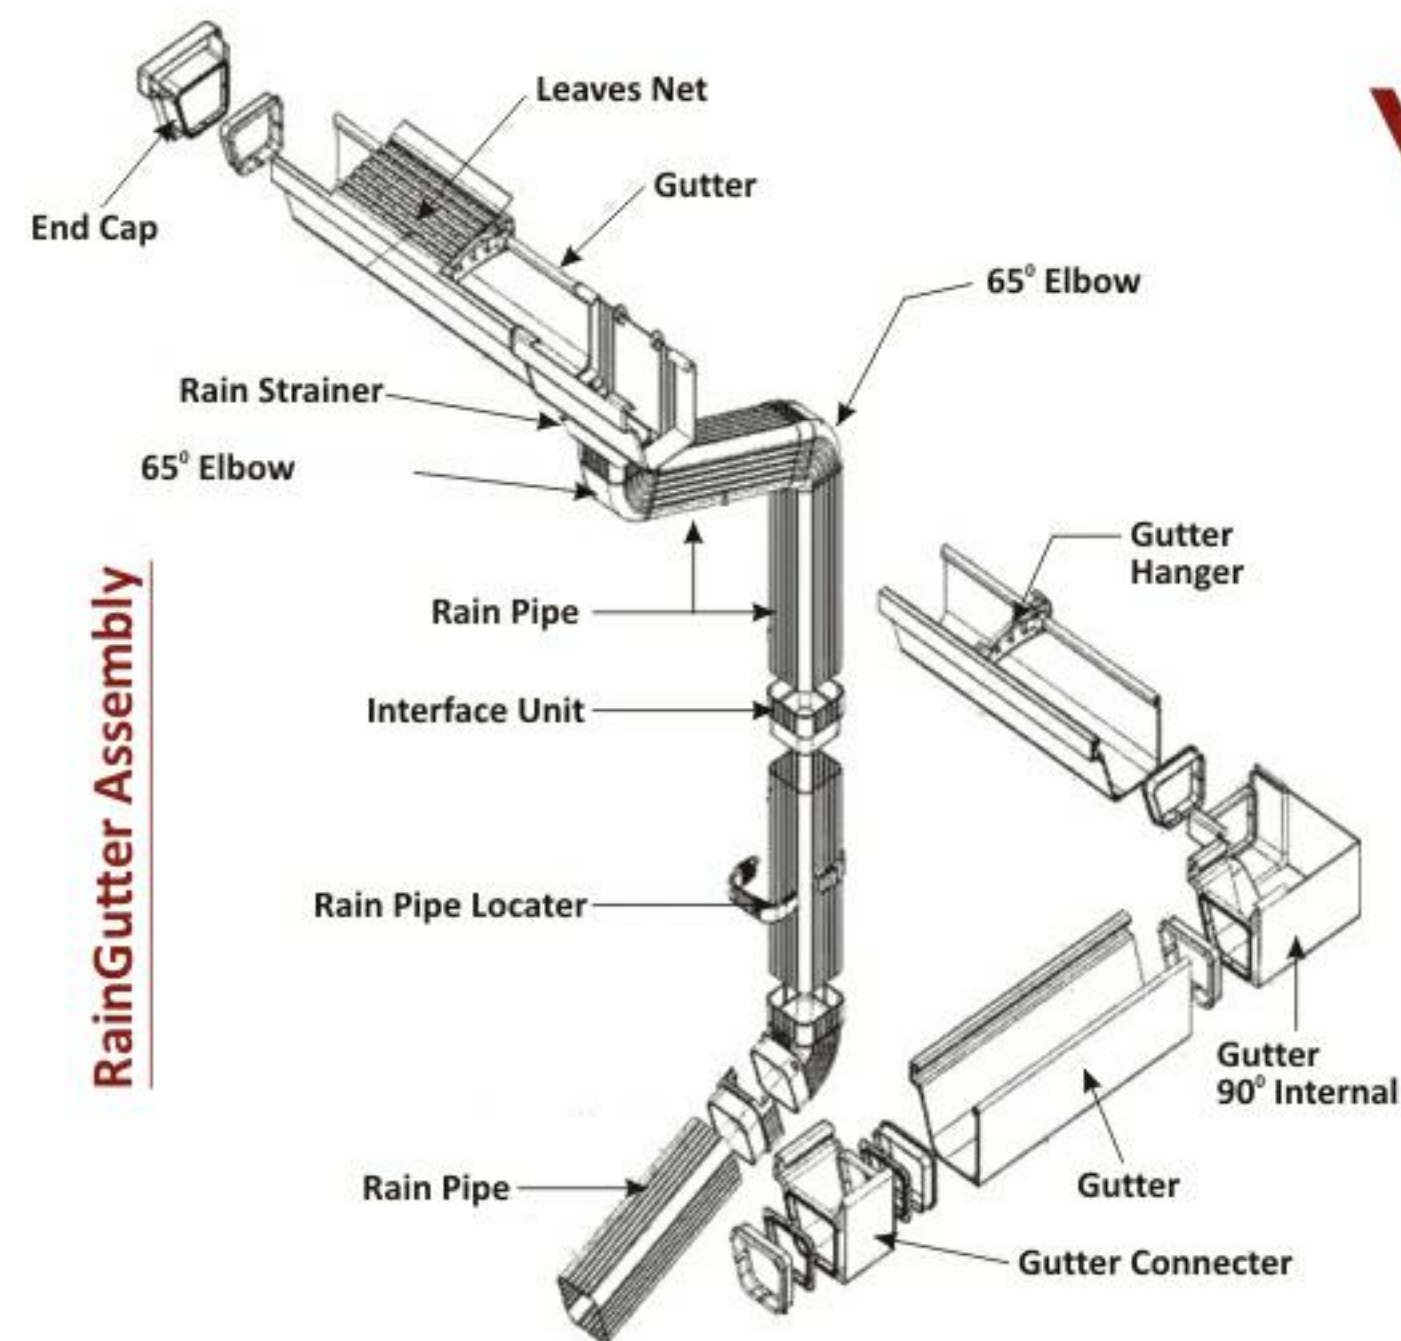

A RainPipe - Water collected by a rain gutter is fed usually via a RainPipe from the roof edge to the base of the building where it is either discharged or collected.

UNIQUE FEATURES OF

ACCURAIN – RAINGUTTER SYSTEM:

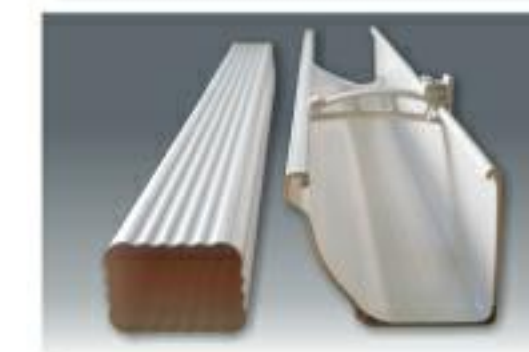

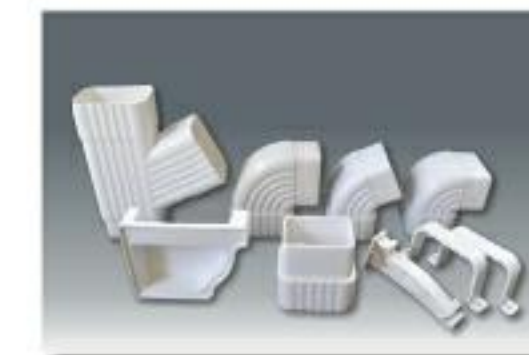

uPVC RainGutter systems are manufactured with international advanced technology & are widely used throughout the world for past 20 years.

- Useful for Rainwater Harvesting / Rainwater management
- Great Aesthetics with long service life
